

Executive Pitch Deck

Potential-Based Allocation Strategy - Western Province

Unlocking Hidden Revenue

The Challenge

Allocate a LKR 5 Million Trade Marketing Budget across the Western Province outlet network.

Our Solution

- We developed a **Potential-Based Allocation Framework** that estimates the latent sales capacity of every outlet .
- That Framework Identifies untapped growth opportunities .
- And directs investment where incremental volume can be maximized.

Design Direction

- ✓ 250 outlets strategically funded
- ✓ LKR 5 Million fully allocated
- ✓ Budget directed to highest-growth opportunities
- ✓ Maximum projected incremental volume unlocked

The Core Problem

OLD APPROACH

OUR APPROACH

What Traditional Models See

- Historical sales = assumed demand
- Constraints (no cooler, missing SKUs) are invisible
- Money flows to already performing outlets

What Our Model Reveals

- Sales = demand intersected with supply constraints
- Spatial signals and peer behavior unmask the true gap
- Budget flows where it generates the biggest incremental lift

How the Framework Unmasked Outlet Potential

Measure the Gap

Calculate volume lift as maximum minus actual sales.

Apply Priority

1.2x boost for high-catchment, low-competition zones.

Model the Ceiling

LightGBM predicts maximum monthly liters using spatial catchment data.

Assign Packages

Match outlets to Tier 1, 2, or 3 based on constraints.

The Opportunity Landscape

922

Goldmine Outlets

Isolated goldmine outlets identified network-wide

250

Outlets Funded

Selected for this allocation round

5M

LKR Deployed

Budget fully allocated across tiers

High-Potential Signals

- **Spatial catchment:** schools, transit, health zones
- **Low competition:** few nearby supermarkets
- **Flat variance:** stable sales signal artificial ceiling
- **Missing SKUs:** peers stock what this outlet doesn't

Allocation Engine

Tier 1 — Core Asset

10 outlets · LKR 90K each
New cooler + billboard

Tier 2 — Visibility

20 outlets · LKR 40K each
Cooler refurb + branding

Tier 3 — POSM

220 outlets · LKR 15K each
In-store materials + promos

Distributor Breakdown

Distributor	Outlets	Budget
DIST W 01	78	LKR 1,650,000
DIST W 02	88	LKR 1,720,000
DIST W 03	84	LKR 1,630,000

Business Impact & Sensitivity Analysis

12.0L

Tier 1 (LKR 90K)

Incremental liters per 1,000 LKR

21.5L

Tier 2 (LKR 40K)

Incremental liters per 1,000 LKR

33.9L

Tier 3 (LKR 15K)

Incremental liters per 1,000 LKR

Sensitivity - What If?

- **LKR 7M budget:** ~80% of next-tier opportunity, modest efficiency loss
- **300 m radius:** ~15 more outlets, cannibalization risk in Colombo
- Always present low / expected / high bands to finance

Regional Growth & Sensitivity Analysis

The optimizer does not spread money evenly , it concentrates it where spatial signals and peer benchmarking confirm the highest recoverable demand.

1

Coastal Tourist Zones

High-density coastal zones near tourist catchments show the largest lift per outlet – leisure gravity drives premium demand surges in high season.

2

Educational Corridors

Peri-urban educational corridors show consistent weekend demand uplift driven by tuition centre footfall – currently underserved by cooler infrastructure.

3

Health Zone Clusters

Health zone clusters near major hospitals yield stable, low-variance lift – predictable returns suitable for Tier-2 investment.

4

DIST W 02 Concentration

DIST W 02 yields the highest total projected lift (88 outlets, LKR 1.72M) due to its densest concentration of goldmine outlets.

Practical Rollout

Tier	Intervention	Required Proof
Tier 1 (LKR 90K)	New cooler + billboard	Cooler installed, powered, branded photo + GPS
Tier 2 (LKR 40K)	Cooler refurb + branding	Cooler refurbished, branding applied, shelf corrected
Tier 3 (LKR 15K)	POSM + trade discounts	POSM installed, promotional materials displayed

Summary

What Was Delivered

- **922 goldmine outlets** identified via spatial catchment intelligence
- **250 outlets funded** with discrete Tier - 1 ,Tier - 2 , Tier - 3 packages
- **LKR 5M deployed** with geographic fairness across 3 zones
- **Anti-cannibalization enforced** - no funded outlets within 500 m
- **Field playbook ready** - CSV, field pack, map pack, checklist

Why This Approach Is Defensible

- Model trained on unconstrained outlets learns true demand
- Every decision traceable to a spatial signal or business rule
- Sensitivity analysis pressure-tests assumptions before committing
- 30/60-day feedback loop makes each round smarter
- All parameters centralized easy to update

✓ **250 outlets funded · LKR 5M deployed** : the argument is complete.
